

Name: Pedro Azevedo Fornazari

Task: Unity Programmer Task

THE CIRCLE'S ROOMS

1. System

Developed game made for the Unity Programmer Task, with the main gameplay mechanics (like movement and items collection), animations, UI, and a save system. The game consists of three rooms. One is the main room with other forms, one is the “Hall of Fame Room” with every main circle collected, and the “Rain Room” with every circle being collected. Goal to collect the maximum circles in the rain. Save method enable for each time you play in the game

2. Thought Process

The idea was to be organized from the beginning of the project. First separating every type of asset I was gonna use in the game. Scripts and Animations were handmade with some references used in certain moments (comments added in the scripts), Prefabs made to make it easier for some spawns, specially the items. Arts made by myself, but easy arts just for the prototype. Sounds and Fonts were gotten online for free (references in *TechnicalDetails.pdf*). Started making a first functional model with the UI and first movement and animations. Advanced to the inventory mechanics, and went to polish the game with some other Unity resources (like Time and Coroutines, etc). Bugs and fixes in the game are commented on every GitHub update.

3. Personal Assessment

I thought this task was pretty interesting. It gave me a “time travel” to remember all my knowledge with Unity and being back to start a game from scratch. With time I was able to catch up, and had some problems and bugs to remember and fix, probably needed more time to polish and to work better in the inventory. I had a lot of things besides the game to do, but in general, I think I did my best in the time I had. My main focus was the organization and trying to have at least a “first complete experience” with this game, even if it’s just a first prototype.
